

Dr. Joseph Schneider - 00:01

Hello, I'm Dr. Joe Schneider and today is a happy day. We just finished with a 10 year old who had many open heart surgeries, seizure activity and he had a lot of anxiety and had a hard time relating not only to his family but to anyone. And today was his last day. Many, many victories along the way. One of the things he had a mold infection that was pretty bad that we had to take care of. But he went through a full program and which we started retraining his brain neurofeedback gyro stem. Now the gyrostim was difficult to even get him on there. So today he did a level 10 for 15 seconds and then he did level 10 for 15 seconds again. Then he did it for 30 seconds and he did it for 60 seconds.

Dr. Joseph Schneider - 01:07

For his last visit today and we're happy to say his he caught up to his development. I think now he's fully a 10 year old, he'll be able to learn better, interact better be social and be brave. He has to be brave. And you know he only had, he almost had me in tears today. From going totally frightened by everything from a laser to neurofeedback to being able to do it all and doing catch and throw in the back and playing and being on the vibration plate interactive metronome that he does like really fantastic now fine motor movements are fantastic also. So like I said there's victories and those victories are hard fought for. Hard fought for.

Dr. Joseph Schneider - 02:12

So we want to really change the neurology of kids that have developmental disorders that have had surgery when they were younger and which would interrupt with their development. And we want to bring them back. And so being in practice now for since 1989 is, it's been a gift, a gift from God for us to be able to do this. So we have faith back practice. We love these kids, we appreciate them and we pray for them and then we rehabilitate them no matter how hard it can be through the process because at the end we get where we want to go with these kids so that they can have a full life again. So many cheers for that. And then what other things happened for us this week was we had a mother that contacted us.

Dr. Joseph Schneider - 03:22

Her, her son's in the military now and I remember this child that we treated in the Brain Balance Springfield and doing really fantastic. And when these kids are struggling, you can't foresee them being successful in life and he is. So that means that brings up a lot of memories because I remember, you know, doesn't matter who they were, how long it was. I remember. I remember the kids. I may not remember their name, but I remember a lot of specifics around the kids that you put your heart and soul into treating and getting them back. And so another successful case. Then I had another mother came to us who. Whose son had autism. And I can remember him sitting on my lap trying to do some of the computer analysis that were doing at the time. And he kept turning the computer off.

Dr. Joseph Schneider - 04:32

I spent an hour with him turning the computer off, turning the computer on. He loved copy machines and electronics. He couldn't get away from it. And he ended up going to college and he graduated from college. And I can remember him doing a speech at Eastern University and talking about starting to get his life back and going to

school and so forth and so on. And I remember going into the school and talking to the teachers and the administration about him starting school. I mean, like, all those milestones that were hit with him were fantastic. And we had. We had another one that was really close to that. Every time he shut his eyes, he fell over. You know, I mean, just he shut his eyes and he couldn't keep his balance and he just fell over every time.

Dr. Joseph Schneider - 05:34

And these two kids were coming at the same time. And I can remember that we got in better, too. So child after child, whether it was autism, Asperger's, learning disabilities, people that kids that had trauma, they were dropped or they fell the crib or something like that started having problems, we got them to where they needed to be to get their life back. And then a lot of traumatic brain injury, a lot of kids that played hockey, sixth, seventh and eighth grade, where they would have, like, really bad injuries. And one of the factors about kids having traumatic brain injuries that you'll notice that they don't do well in school anymore, they start having oppositional problems and anger and so forth, or they start being incredibly adhd. And we've seen that.

Dr. Joseph Schneider - 06:39

We brought kids through that and got them back in school, got them caught up in school, got them back to playing hockey and participating in things. It's been a wonderful career. And I'm not retiring. You know, I'm not. It's not one of these. These videos that we're saying about retiring. I'm not retiring. What I'm saying is that these kids that are having issues need to go to the right places to get fully rehabilitated. So they have their life back. The family has their life back, and they're ready to go so if you have a child that needs help, click on the link above. Schedule a consult with us. We have a dynamic, wonderful center with all the best technologies, all the best experienced personnel, and we can get your child to be transformed just like you want. Thank you.

Dr. Joseph Schneider - 07:38

Have a great day, and we'll see you either in the office or on a call.
